Search Notes

Mark,

X

all of the requested segs contain bunches of Xaa's. With standard search parameters, Xaa's in either the query seq or the database seq are considered non-matches, so I don't know how useful you will find these results to be. We have an alternative search that can be done in cases like this, called "DX matching table". With this matching table, Xaa in the query sequence matches anything in the database seq. Xaa in a database seq still is considered a non-match.

If you think DX matching table results would be more useful to you, please let me know. Barb

Hello Barb,

Could I trouble you for a search and an interference search of:

SEQ ID NO: 13-18

Thanks

Mark

      Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                               Score

Best Local
The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus sydenes) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN65044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.
                                                                                                                       Claim 1;
                                                                                                                                                           or disease caused
                                                                                                                                                                                                 N-PSDB;

The superantigen polynucleotides and polypeptides are used for subtyping Streptococci. They are also used for diagnosing Streptococcal disease. The superantigens are used in diagnosis of disease such as Kawasaki syndrome. They are also useful to recruit and activate T cells in a relatively non-specific fashion since they bind a large number of T cell receptor molecules by binding to
                                                                                                                                                                                                                                                                                                                                     27-OCT-2000;

                                                                                                                                   Reagent for treating cancer without the need for e.g. radiotherapy, comprises a specific V beta subset of {\tt T} cells sensitized to a growing tumor and stimulated with superantigens
                                                                                                                                                                                                Terman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds t (I). A composition comprising (I) or a nucleic acid encoding (I), may used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningilis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity

The present sequence corresponds to amino acids 151-167 of enterotoxin C1 (SEC1, see ABB76238) of Staphylococcus aureus. Sequence similarities are found in the corresponding regions of other staphylococcal enterotoxins and streptococcal pyrogenic exotoxins (see ABB76252-59). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and enterotoxin B, and to streptococcal pyrogenic exotoxins, with statisfically significant sequence homology and similarity,

Nucleic acids encoding a peptide of the invention can be used for the production of the peptides for diagnostic reagents, as vaccines and for therapies for pyrogenic exotoxin related diseases. Vectors expressing high levels of the peptides can be used in immunotherapy and immunoprophylaxis when expressed in humans. The antibodies are used for passive immunisation therapy to prevent or increase resistance to toxic shock syndrome or septic shock and to ameliorate the effects of conditions associated with the presence of staphylococcal or streptococcal pyrogenic toxins. The amino acid sequences of the peptides are sufficiently common that they can be used for eliciting antibodies which are cross-reactive with toxins derived from various bacteria. Sequences AAY97853-Y97861 represent

They stimulate CD4+, CD8+ and gamma-delta+ T-cells by binding the beta-chain variable region (V-beta) elements on the lateral face of the T-cell receptor (TCR) while simultaneously binding the lateral face of the class II major histocompatibility complex (MHC) of antigen presenting cells. This causes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pyrogenic toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the immune system, causing injury to the host. The peptides are used to prevent, treat or protect against toxic shock and septic shock resulting from bacterial infections in mammals, particularly humans. The peptides are used for inducing serum antibodies that bind at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and septic shock caused by the staphylococcal and streptococcal pyrogenic toxins. The pyrogenic exotoxins of Group A streptococche enterotoxins of Staphylococcus aureus (which are also pyrog

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell sample which may enable the diagnosis and improved treatment of nervous system

                                                                       probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                                                                    The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples -

WPI; 2002-114183/15

Claim 27; SEQ ID No 31161; 634pp; English.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of complements or the 1287 open reading frames derived from the 12614 probes; the novel set of probes which hybridise at high stringency to a collection of detectably labeled nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; measuring gene expression in a collection of detectably labeled nucleic acids derived from human lung measuring gene expression of the expression of detectably labeled nucleic acids derived from human lung a comprising the label detectably bound to each probe of the entray; identifying exons in a eukaryotic genome, comprising comprising comprising exons probe, and to probe, and to predict acids from entrayotic genome, comprising comprising capital predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably beauting a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exon in several tissues and/or cell types using hybridisation to a single gene, comprising one of 12011 sequences, mentioned in the exon, where a common pattern of the expression of the exons in several tripes and the exons in the tissues and/or cell types indicates that the exon sequence in the specification, or encoded by the probes of the analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung disease (EOPD), interstital lung disease (IID), femilial idiopathic pulmonary disease.

Nemann-Pick disease, Hermansky-Pudlak syndrome, fabrocystic pulmonary disease, pulmonary hypertension in the disease, hyphangiolelonyomotosis, pulmonary hypertension

                                                                                                                                                                                                     useful for preventing or treating infectious diseases due to microorganisms in animals such as cows, plys, horses, sheep, hens,
                                                                                                                                                                                                                             The present sequence represents a modified Staphylococcal enterotoxin C1, designated SEC-SER. The modified toxin is characterised in that the 95th amino acid (cysteine) is substituted with serine. This results in a toxin that has improved stability. The modified enterotoxin is

                                                                                                                                                                                                                                                                                                                                                                                            treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEC3. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles.

These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered observed for the Protein A perfusion system.

19-JUN-1995;
03-OCT-1989;
       The present sequence is the protein sequence of enterotoxin C3 (SEC3) of Staphylococcus aureus. Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal exfoliative toxins (see ABB76.344-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           conjunction with an antigenic stimulation for cancer therapy by stimulating an in vivo or ex vivo.
                                                                                                                                        Reagent for treating cancer without the comprises a specific V beta subset of T tumor and stimulated with superantigens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Staphylococcus

                                                      SEC1 was isolated and purified from S.aureus. It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEC1. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          statistically significant sequence homology and similarity (2 value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding to include allygment of cysteine residues and similar hydropathy profiles. These superantigens are used to treat solid tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with one or more superantigens ex vivo to generate stimulated cells, selecting a specific v beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating cancer with enterotoxin from Staphylococcus aureus - administered by IV injection, having same tumoricidal activity

C-1- FUNCTION FOINT. IT IS NEEDED TO TRANSLATE MENA WITH A SHORT SHINE-DALGRANO (SD) PURRIME-RICH SEQUENCE (BY SIMILARITY).
C-1- SIMILARITY: BELONGS TO THE S1P FAMILY OF RIBOSOMAL PROTEINS.
C-1- SIMILARITY: CONTAINS 6 S1 MOTIF DOMAINS.
